## Differences in Application Between Power Dividers and Power Splitters

### Application Note

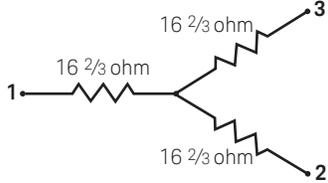

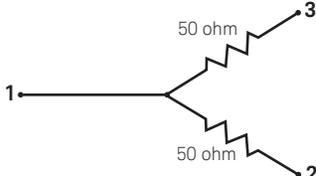

## Introduction

Power dividers are an RF microwave accessory constructed with equivalent 50 Ω resistance at each port. These accessories divide power of a uniform transmission line equally between ports to enable comparison measurements. Power dividers provide a good impedance match at both the output ports when the input is terminated in the system characteristic impedance (50 Ω). Once a good source match has been achieved, a power divider is used to divide the output into equal signals for comparison measurements. The power divider also can be used in test systems to measure two different characteristics of a signal, such as frequency and power, for broadband independent signal sampling. Besides dividing power it also can act as power combiners because they are bi-directional.

Power splitters are constructed of two resistors. They are used for leveling and ratio measurement applications to improve the effective output match of microwave sources. The two-resistor configuration also provides 50 Ω output impedance to minimize measurement uncertainty in source leveling or ratio measurement applications.

### Characteristics of power dividers and power splitters

| Power dividers  | Power splitters   |
|---|---|
| <ul style="list-style-type: none"> <li>- Divide a signal equally for comparison measurements</li> <li>- All ports have equivalent 16 2/3 Ω resistance</li> <li>- Can be used as power combiners</li> <li>- SWR 3:1</li> </ul> | <ul style="list-style-type: none"> <li>- Used in ratio measurements and leveling loop applications</li> <li>- Only the input port has a 50 Ω resistance, the other two ports have 83.33 Ω impedance</li> <li>- SWR 1:1</li> </ul> |
|    |    |

### Key specifications of Keysight Technologies, Inc. 11636C power dividers and 11667C power splitter

| 11636C power dividers   | 11667C power splitters   |
|---|--|
| <ul style="list-style-type: none"> <li>- Operating frequency: DC to 50 GHz</li> <li>- ± 0.3 dB amplitude tracking</li> <li>- ± 2° phase tracking</li> <li>- Low SWR 1.67</li> </ul> | <ul style="list-style-type: none"> <li>- Operating frequency: DC to 50 GHz</li> <li>- &lt; 0.4 dB tracking between output ports</li> <li>- Excellent output: 1.10 SWR at the auxiliary port</li> </ul> |

## Power Divider and Power Splitter Applications

### Power divider applications

#### Low power signal distribution to two antennas

In this application, a power divider divides the power into two antennas at the same time. Figure 1 shows how to make a simple connection to a power divider which distributes the low power signal equally into two antennas at one time.

#### Intermodulation distortion (IMD) measurements

Power dividers can be used as power combiners for IMD measurements. IMD measurements require a signal with the appropriate phase relationships among the carriers to simulate real life conditions and provide repeatable results. A power divider accurately combines two signals from the two difference signal sources into one signal for the device under test (DUT). A spectrum analyzer is used to examine the output of DUT while it is being stimulated with multi-tone test signal.

Figure 2 shows the traditional measurement setup used to measure the IMD product with a two-tone test stimulus.

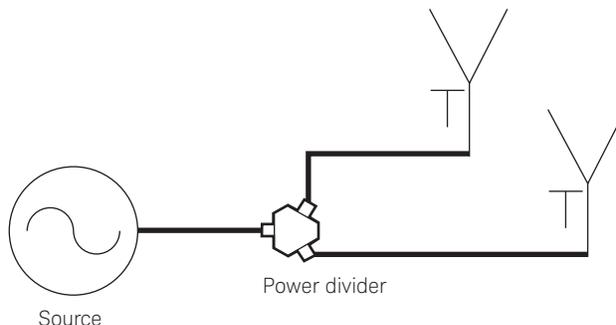

Figure 1. Simple test setup for power dividing application

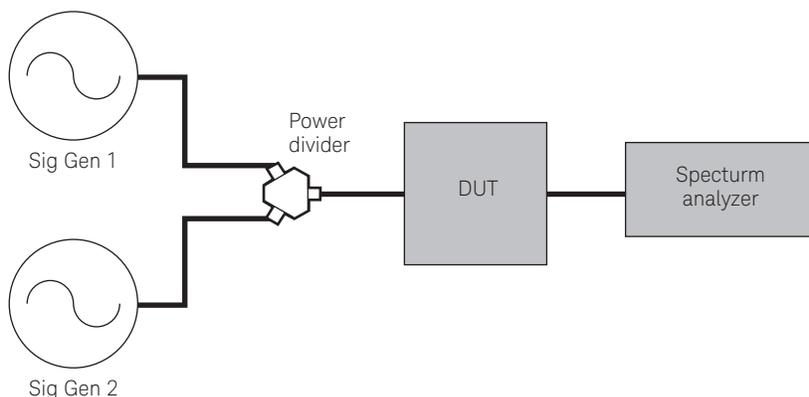

Figure 2. Power divider test setup for IMD measurements

### Diversity gain measurements

The electromagnetic field in multipath environments is very strong in some positions and very weak in others. A power divider can be used to measure the diversity gain of the handset. Figure 3 shows how to connect a power divider

This measurement setup is used to measure the diversity gain of digitally-enhanced cordless telecommunication (DECT) devices. The base station sends a slot through a power divider to a wall antenna selected by the switch. The handset then radiates the signal back to the base station. The handset is placed in a reverberation chamber so that a spectrum analyzer can receive and measure the radiated power of the signal.

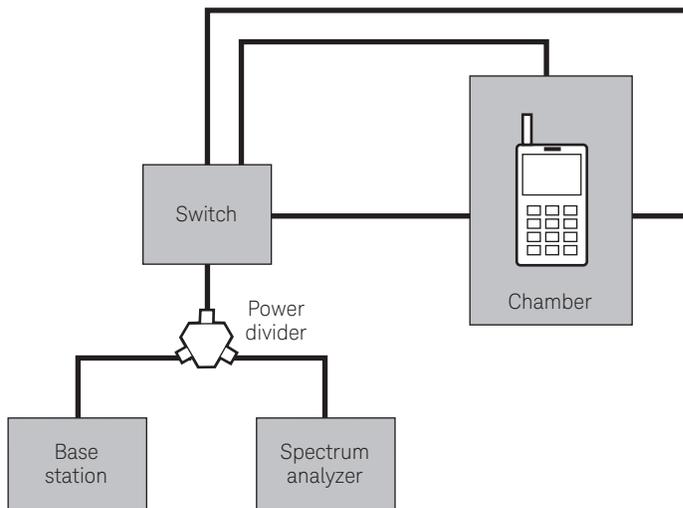

Figure 3. Power divider test setup for diversity measurements

### Power splitter applications

#### Gain, compression and isolation measurements

Power splitters can be use for gain, gain compression and power testing. Figure 4 shows the basic test setup for amplifier gain, compression and power testing. The power splitter provides signal ratioing that improves the source match and removes re-reflected signals so gain measurements can be taken at different RF power levels without re-calibrating.

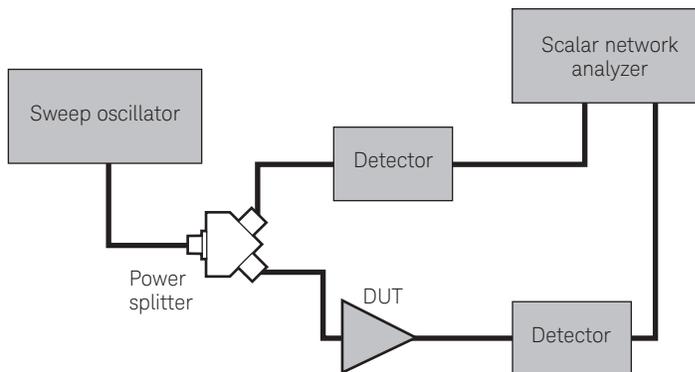

Figure 4. Simple test setup for power dividing application

### Ratioing or leveling

The effective source match can be improved by ratioing or leveling the source externally. These two methods also provide similar source match improvement. Figure 5 shows the source leveling technique that uses an external crystal detector. Figure 6 shows the source leveling technique using a power meter.

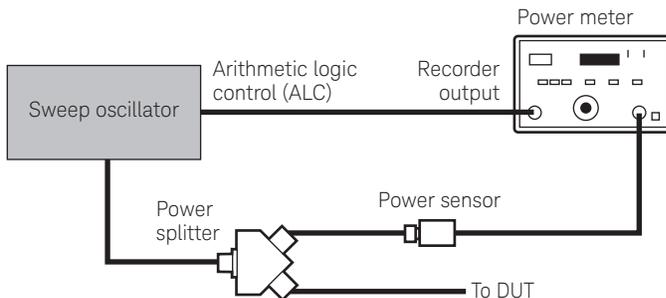

Figure 6. Power splitter test setup for leveling with a power meter

## Conclusion

Power dividers and power splitters perform different functions in test systems and, as seen in the applications above, are not interchangeable. For simple power dividing and combining, the three-resistor power divider should be used. For ratio measurement and leveling, the two-resistor power splitter is the right choice.
